| Low performing Districts by Connectivity Efficiency |             |                      |                         |                   |  |
|-----------------------------------------------------|-------------|----------------------|-------------------------|-------------------|--|
| District                                            | Cost per Km | Total Sanctions Cost | Connectivity Efficiency | Total Habitations |  |
| ⊕ Shamli                                            | 34.30       | 1,753.44             | 13.7%                   | 7                 |  |
| ⊕ Bijnor                                            | 33.59       | 1,093.36             | 15.4%                   | 5                 |  |
| ⊕ Sonbhadra                                         | 28.34       | 16,374.41            | 16.8%                   | 97                |  |
| ⊕ Mahrajganj                                        | 39.06       | 904.12               | 17.2%                   | 4                 |  |
| ⊕ Maharajganj                                       | 39.23       | 910.35               | 17.3%                   | 4                 |  |
| ⊕ Amethi                                            | 44.48       | 4,887.02             | 18.2%                   | 20                |  |
| ⊕ Chandauli                                         | 28.85       | 1,254.94             | 18.4%                   | 8                 |  |

Quick Insights

- These blocks exhibit the lowest road connectivity efficiency in Uttar Pradesh.
- Lower efficiency indicates fewer habitations connected per km of road.
- These areas may require targeted planning, optimization of road alignments, or enhanced implementation monitoring.
- Maintenance expenditure should be assessed alongside connectivity outcomes to improve long-term sustainability.
